Increasing the Clover Crop

Every farmer knows that if he plows up a clover meadow he increases the fertility of that field. One of the reasons for this is that the clover contains a large store of the valuable fertilizing element, nitrogen, and as the clover plants decay in the soil this nitrogen becomes available for the use of the succeeding crop. The question naturally arises, why is it that the clovers add more nitrogen to the soil than other crops. The farmer may have noticed as he turned up the roots of the clover that there were scattered along the roots, especially on the finer rootlets, little whitish nodules or bunches. If he had cut one of these little nodules in two with a sharp knife he would have seen that the inside was pinkish white, and if he had a powerful microscope at hand he would find on examining this pinkish white substance that it was largely a mass of very tiny rods, some straight, some curved, and some T or Y shaped. These rods are bacteria. These bacteria get into the fine roots when the seed germinates, grow and multiply there as the clover plants grow, and as they grow they draw upon the nitrogen of the air in the soil and store this nitrogen up in the clover plant. Hence, the clover plant by the aid of these bacteria is able to grow, and to store up more nitrogen than it needs and which it can supply to succeeding crops. Without the bacteria the clover plant must get all its nitrogen from the soil instead of getting much of it from the air, and hence when the clover is plowed under there is no actual increase in the fertility of the soil. In fact, clovers make the best growth when there are plenty of bacteria present in the soil, as shown by the presence of lots of nodules on the plant roots. This is explained more fully in bulletins Nos. 164 and 169 of the Ontario Department of Agriculture, Toronto, which may be obtained by addressing that department.

These bacteria can be grown under artificial conditions in bacteriological laboratories, and cultures of them may be applied to the seed when it is sown, thus furnishing plenty of the appropriate bacteria to get into the newly formed roots and form the necessary nodules. When there is failure to get a good stand of clovers, or when the crop does not thrive, it indicates usually that the necessary bacteria are not present in the soil, and in such cases the treatment of the seed in future seedings, as mentioned above, usually aids in securing a better crop. Further, the use of such cultures is usually advisable when seed of any clover is sown on new land or on a field that has not previously grown that crop.

Each year since 1905 the Bacteriological Laboratory of the Ontario Agricultural College at Guelph, has sent out such cultures to all farmers who applied. Each year, recipients of the cultures have been asked to report as to whether the treatment of the seed had resulted in benefit or not, and of these reports about 65 per cent. have stated that the cultures had aided in securing a better stand and increased growth of the crop. The College is preparing to send out cultures of these nitrogen-gathering bacteria

during the coming spring for the inoculation of the following seeds; Alfalfa, red or mammoth clover, alsike clover, white clover, crimson clover, vetches, peas, beans, sweet peas. Each kind of seed requires a different culture. The cultures are sent by mail with full instructions for their use. There is only one size package prepared, that being sufficient to inoculate sixty pounds of seed. There is a nominal charge of 25 cents for each package of culture to clover cost of preparation and postage. Farmers intending to secure the bacterial cultures would do well to send in their application early so that they may be sure of getting the culture in ample time for seeding. Applications should state the kind and amount of seed to be treated, and should be addressed with enclosed postal note, stamps, or money order to, Professor S. Edwards, Ontario Agricultural College.

Predicts Famine in Timber

"Instead of speaking of Canada's timber wealth, I prefer to speak of her lumber famine," said Professor A. H. D. Ross of the faculty of forestry, in lecturing in Toronto the other night.

Considerable divergence of opinion existed, said the speaker, regarding the extent of Canada's timber area, but he estimated the acreage of commercial timber at about 250,000,000 acres, or 500,000,000,000 feet. The annual cut was approximately a little over 4,000,000,000 feet, but he pointed out as the country developed, the demand for timber increased proportionately, and unless some method of conservation was arrived at, in a hundred year's time, Canada would be facing a timber famine.

The danger of promiscuous felling of large timber was well illustrated by Professor Ross, who cited the case of Southern France, where a century ago, immense tracts of forest land had been burnt. This procedure had resulted in the flooding of vast portions of contiguous lands, which were costing the French nation enormous sums in the effort to reclaim them for cultivation.

The speaker condemned the criminal carelessness of inexperienced campers, who either through ignorance or wilfulness were the cause of many forest conflagrations, and remarked that a common saying in Europe was that "only Americans and Turks burn forests."

Ontario, he continued, had no forest policy, but he hoped the day was not far distant when the crown lands department would look after the timber preserves. Several other provinces had started in the right direction, by preserving forest areas, and he thought that policy should be carried out in order to ensure a systematic conservation of timber heritage.

In conclusion, he paid a glowing tribute to the conservation commission, which, under the chairmanship of the Hon. Clifford Sifton had been instrumental in safeguarding Canada's natural resources, and he advised his audience that the care of her timber was essential if Canada was to develop as a great nation.

The March Home Journal.

"Mrs. Watts told us that among his intimates, Watts was ever the simple hearted and wondering 'child' who saw possibilities in everyone and everything. 'Think of the flowers,' he would say, 'they look to the sun until their petals are the rays of light, and remember we all have our message to deliver. It does not matter who we are, or where we come from we must give the message we were meant to bear. All the knowledge and experience you may gain is nothing, if you cannot bring out of it the thing or the thought that is of use to others.'"

He would pause, as he passed the beautiful sun-dial in Celtic design, given by his wife, with his own motto upon it, "The Utmost for the Highest."

That is the best thing I ever did, to think of that motto, he said humbly. And, indeed, he gave his utmost.

From "The Art of George Frederick Watts" by Katherine Hale in the March Home Journal.

D. M. Allen is agent for the Simcoe Steam Laundry. Basket leaves Wednesday morning and returns Friday evenings. First-class work guaranteed.

The Doctor's First Question

"How are your bowels?" This is generally the first question the doctor asks. He knows what a sluggish liver means. He knows what a long list of distressing ailments result from constipation. He knows that headaches, bilious attacks, indigestion, impure blood, and general debility are often promptly relieved by a good liver pill. We wish you would talk with your own doctor about this subject. Ask him at the same time if he approves of Ayer's Pills. Do as he says. J.C. Ayer Co., Lowell, Mass.
