SEED POTATO STORING

Practical Advice Regarding Their Winter Placing and Keep.

The Stored Tubers Require Oxygen—Importance of Ventilation—Influence of Temperature—Look Over Seed at Planting—Danger to Hogs in Feeding Salt.

(Contributed by Ontario Department of Agriculture, Toronto.)

The potato is a living organism and if not kept under conditions favorable to continued life will die. Seed potatoes frequently fail to produce plants. The cause may be due to the death of the buds before planting.

Oxygen a Necessity.

All living plants require oxygen, and with the potato in storage this is obtained directly from the air. Potatoes in storage take in oxygen and also give off carbon dioxide and heat. The carbon dioxide and heat are harmful, and will destroy the tubers for seed purposes. Potatoes stored in dead air for 100 days rarely sprout and grow when planted. Potatoes stored in a moisture saturated air generally mold, soften and rot. Potatoes for seed purposes should be dry, clean and cool when placed in the storage bin or cellar—a dry earth floor is to be preferred.

Ventilation Important.

The ventilation should be arranged so that air is admitted at the bottom of the bins, move upwards very slowly and out at the ceiling or roof through ventilators designed to carry away water vapor and heat. Small bins separated by an air space or some arrangement such as an air box or double slatted gate that will prevent dead or warm air accumulations are to be preferred to large bin storage where the temperatures may run too high or the air become moist and dead.

Influence of Temperature.

Potatoes stored in cellars when the temperature is kept at 55 degrees will sprout in about 75 days. If the temperature is kept at 45 degrees the sprouting will be slower, usually about 125 days. A 40 degree temperature will delay the sprouting still further, holding up the maturing process so that the buds do not start while in storage until about 200 days from the time of entering the storage. Temperatures of 50 degrees and upward, together with light generally give considerable trouble through inducing sprouting. Cellars that can be kept under 50 degrees and given sufficient ventilation to prevent dead air or moisture accumulations are generally satisfactory.

Examine Seed at Planting Time.

At planting time the seed may be firm and look all right. If it fails to send up good strong sprouts in reasonable time after planting you are advised to investigate the conditions under which the seed potatoes had been stored as one of the possible causes of failure. Plant live seed and get a one hundred per cent. stand of vigorous plants. In buying seed potatoes get them early, examine the buds and if in doubt about their vitality plant a few early and watch developments before planting the main crop.—L. Stevenson, Secretary Dept. of Agriculture, Toronto.

Danger to Hogs in Feeding Salt.

Salt is dangerous to hogs. Though, like other animals, swine crave salt they are more easily poisoned even by small quantities of it. If they receive small amounts regularly at first they seem to develop a tolerance for salt, but care must be exercised in giving it to them.

Certain pigs were allowed to graze in pastures with cattle where they had access to a salt lick or trough, licked the salt ravenously, and all but three of the herd died. In another case where salt brine was mistaken for sugar-water and fed to hogs with garbage, the pigs were poisoned and died within 48 hours. Salt-poisoned pigs usually show no symptoms until from 12 to 24 hours or more. They then show increased thirst, dizziness, or a deep stupor, frothing at the mouth, refusing feed, and sometimes being afflicted with vomiting or diarrhoea. Death usually follows after 24 hours.

Treatment in such cases may consist of a dose of two teaspoons of cornstarch boiled in two ounces of water until thick and then diluted with water enough to make one pint; or a tablespoon of unground linseed mixed with water until it makes a mucilaginous mass.

When salt is given to pigs it should be included as an ingredient in a mixture containing three parts each of sodium sulphate, sodium chloride (salt), sodium carbonate, iron sulphate, and one part of flowers of sulphur. This may be placed in some kind of a self-feeder where hogs may have free access to it, or, it may be given by mixing from three to five tablespoons to a barrel of slop-feed, or from two to three tablespoons to the bushel of dry feed, mix thoroughly.

It is not advisable to have salt alone in any kind of container at the free disposal of hogs.

Place for Horses to Roll.

Where horses are closely confined in stalls most of the time, they are more apt to roll in the dirt and manure than if they had been taken out and allowed to roll once a day. Letting them roll outside of stalls saves much currying and brushing, avoids the possibility of the animal rolling where it would get fast, and adds to its health and vigor by keeping it cleaner.

Death Sentence Upon Meharz is Commuted

Ottawa, Jan. 7.—The governor-in-council has commuted the sentence of death passed upon Wilfred Meharz, a farmer's son, of Wentworth County, Ont., to life imprisonment. Meharz was sentenced by Chief Justice Sir William Mulock at Hamilton. The date of execution was set for January 18. He was found guilty of murdering Dr. Whitworth, of Hall's Corners.

It is understood that the principal plea of the defense at the trial was that the shooting was accidental. Emphasis was laid on the fact that at the time the shooting occurred Meharz was only 21 years of age and had apparently been led astray by evil companions.
