Unknown St. Paul's.
Interesting facts in connection with St. Paul's Cathedral are recalled in "The Cathedrals of England and Wales," by Mr. T. Francis Bumpus. Sir Christopher Wren's salary was only \$200 a year. "It was supposed that in order to continue in the enjoyment of this munificent sum he delayed the works, and in an act passed in 1696 there was a clause authorizing the suspension of a moiety of the sureror's salary until the church should be finished, 'thereby the better to encourage him to finish the same with the utmost diligence and expedition,' and it was not until Christmas, 1711, that the moiety was paid him." He was dismissed after 49 years' services, when he was 86. St. Paul's was begun and finished within forty years, under one Bishop of London, one architect, and one master mason. The mason of Tillingham, Essex, with which the cathedral was endowed about 679 A.D., continues to form part of the fund for the sustentation of its fabric. The great peculiarity of the dome of St. Paul's, says Mr. Bumpus, is the invisible conical structure of brick interposed between the inner and outer domes, resting on the lower circumference of the former, and serving to support the stone lantern. The supporting cone is most ingeniously modified at its upper part to leave eight windows and support the full weight of the eight masses of the lantern.

SASKATOON'S UNIVERSITY FOR THE PRAIRIES

Upper Picture.—One end of the Administration Building, University of Saskatchewan, with the Engineering Building in the background.
Lower Picture.—A Travelling University, showing how instruction is carried to the farmers of Saskatchewan.

Long after the ivy peered in at the upper windows of such splendid universities as Oxford, Cambridge or Harvard, such an institution as the University of Saskatchewan had not even been imagined. When Sir Wilfrid Laurier, who laid the cornerstone of this new university July 23rd, 1910, was a student poring over his books few but Indians had stood on the height of land which is the site of the buildings shown in the accompanying photographs, and watched the waters of the South Saskatchewan River gliding swiftly and silently northward.

Although the prairie soil was as rich and the river as broad and full then as now, the City of Saskatchewan was uncompleted. Even as late as twenty years ago, where now stands a city of 30,000 people on three lines of railway, there were not one hundred men, women and children and these were housed in a few tents and shacks. The wildest enthusiast would hardly have dared to prophesy that one day a university would grow there—yet there it stands!

The buildings of the University of Saskatchewan crown the height of land north east of Saskatoon and the site could hardly have been more fortunately chosen. It includes half a mile of well-wooded river front and altogether embraces 1,333 acres of rich land, 233 acres of which are set aside for a campus, 160 acres for purposes of agricultural experimentation and \$80 for the Agricultural College farm. The plan provides for the eventual accommodation of 5,000 students.

The present buildings consist of an administration building, containing a hall and offices for the different departments as well as class

rooms, two students' residences, one containing a spacious dining hall and other a gymnasium and swimming pool; an engineering building; livestock pavilion and up-to-date model farm buildings. All the buildings conform to the pre-conceived plan and while those already erected, be of stone in the Gothic style. Work has just recently begun on a new science building. There are also several private residences on the campus, the two principal ones provided for in the architect's plan being those of the President of the University and the Dean of Agriculture. The buildings of Emmanuel College, a church of England Divinity School, the first of its kind in Saskatchewan also occupy a part of the campus. The University grants sites of from three to five acres to such affiliated colleges at a nominal rental. Eight thousand dollars has already been subscribed towards a beautiful structure which will be the home of the Presbyterian College.

The university provides degrees in Arts, Science, Law, Agriculture, Civil Engineering and a Diploma in Pharmacy.

The present enrolment is between 1,400 and 1,500, including returned soldiers who are retraining in various branches of skilled work, particularly engineering. Scores of promising returned soldiers have been turned out as capable motor mechanics. Steam engineering and the handling and repairing of farm tractors are also taught. Agricultural students, principally the sons of farmers, are training in livestock handling and judging, and even in the care and management of poultry.

An important feature of the work of the University of Saskatchewan

TEST YOUR SEED CORN

Seed With Strong Vitality is an
Absolute Necessity.

Give Your Seed a Careful Germination Test—It Should Run 95 Per Cent.—The Mulberry In Ontario—Home-made Spray for Flies.

(Contributed by Ontario Department of Agriculture, Toronto.)

Two ears of corn may be used to plant two rows side by side. The seed may weigh the same and look the same, but the results in plant development and yield is frequently vastly different. Two stalks may stand together in the same hill, enjoying similar conditions for growth and development. One may produce a good ear while the other produces an inferior nubbin.

Seed With Good Vitality a Necessity.
The difference is traceable to the seed. Good vital seed from select stock will generally give strong plants and full ears. Unselected seed will give a few good plants and many medium or barren plants. Enormous loss and waste would be prevented each year if care were exercised by all purchasers of seed corn. A few hills missed in each row, a few weak or barren plants distributed over the corn field, reduce or eliminate all opportunity for profit. The interest, taxes and wages have to be paid in full no matter what the crop is, and the more frequent the missed spaces, barren stalks, and weak stalks in the corn field the less there is to pay with.

Give the Seed a Germination Test.
All seed corn should be given a germination test before planting. One poor seed ear going into the planter means a waste in land, and labor that is best expressed by one thousand weak or worthless stalks. The corn grower can't afford to neglect the quality of the seed he sows.

Plant one hundred seeds two or three weeks in advance of the regular corn planting date, using a box of moist sand placed in a warm window as a germinator. Count the strong plants at the end of ten days; there should be at least 95 of them. If the test shows any weakness discard all the seed and secure another supply with a guaranteed germination test.—L. Stevenson, Secretary, Ontario Department of Agriculture, Toronto.

The Mulberry.

The old-time fruit-bearing mulberry has lost its place in the gardens of southern Ontario. Better fruits have crowded it out, until it is rarely seen in the modern garden or fruit plantation. Sometimes planted as a food tree for birds by bird-enthusiasts or by those desiring to play with silk worm culture in this northern climate. During the past year, through southwestern Ontario mulberry trees have been offered to the public by traveling agents. The experience of the past with the mul-

A BUSH FRUIT ENEMY

How to Control the Currant and
Gooseberry Worm.

The Caterpillar Described—Comparatively Easy to Kill—Popular Varieties of Strawberries—Calf Feeding a Real Problem.

(Contributed by Ontario Department of Agriculture, Toronto.)

The most common insect enemy of currants and gooseberries is the currant and gooseberry worm. The larvae attack the foliage of gooseberries and of red and white currants but seldom injure that of black currants. At first they work chiefly in the central part of the bush, stripping the leaves nearly all off there and doing much damage before they are observed. Later they may devour the foliage any place. It is common to see nearly all the leaves eaten off numerous bushes.

Life History.
The life history of the insect is as follows: The adults, which are known as sawflies, are small four-winged flies about a quarter of an inch in length. The female has the abdomen yellowish and the rest of the body blackish in color. The male is for the most part blackish or black. The flies appear in spring very soon after the leaves have expanded. Eggs are laid on the under surface of the leaves in chains along the main veins. The young larvae on hatching feed upon the foliage, and become full grown in two or three weeks. Then they drop to the ground and form little cases in which they pupate, a new brood of flies emerge, lay their eggs, and from these there comes a second brood of larvae which may be seen on the plants at the time when the currants are ripe. When these larvae are full grown they enter the soil, form little cases or cocoons, and remain there till the next year, when they pupate and emerge as adults.

Method of Control.
These are easy insects to kill. All currant bushes and gooseberries should be sprayed with from two to three pounds arsenate of lead paste, or half that amount of the powder form, in forty gallons of water as soon as the leaves have become well expanded. Particular care should be taken to spray thoroughly the inner parts of the bush. This will kill all the first brood. If a second brood appears heliothere should be used instead of arsenate of lead, in the proportion of one ounce to one gallon of water. Arsenate of lead would be dangerous on the ripe fruit. The insect occurs everywhere in the Province, and everyone should prevent his plants being weakened and seriously injured by it, especially as it is so easy to control.

Notes: Heliothere loses its insecticidal properties unless kept in airtight packages.

Importing Quail.

A consignment of live quail from Spokane has been received by the Provincial Game Board, for release in the uplands district. These birds were given in exchange for Montolian pheasants. Another consignment is expected from the Eastern States in exchange for pheasants.

A Convincing Argument.
"What's this?" said John Smith, as he came upon his wife's new sewing machine knee deep in a snow drift.
"Oh, I just put it out there to keep your mower company," replied his wife.

Cut the first crop of alfalfa when starting to bloom.
The value of the motor truck as an aid in marketing farm products is now well established. In bringing this about improved roads have been an essential factor.

If home-made lime-sulphur solution is to be used, make it now and store till needed.
Insects that eat the foliage must be kept in check by spraying with a solution that will like paris green or arsenate of lead.

More about Falls' Department Store and Its Opportunities

**Wednesday Half Holiday Until Further
Notice. Store Closes Each Wednesday at 12
O'Clock.**

Night Gowns For Large Women. New arrivals are in White Nainsook with embroidery, lace and hemstitching. Also in Pink Batiste. Specially priced at \$1.37, \$1.50 and \$1.57.
