Man-Power.

There is no completely self-suffi-cient mechanical substitute for a man From time to time the scoffer has arisen to tell us how he would improve the human machine were he th Creator; but he never has been able to demonstrate by means of a working model. Behind every improvement history records there are the thinking mind and the toiling hand of a human being. All the labor-saving devices cannot dispense with a human prime mover, a personal agent. The course of affairs is still powerfully affected as one man arises, asserts himself, and sways others to his plan. Nor does this mean the man who stands up and talks smoothly, at any length desired. For a while Kerensky stampeded Russia with his passionate monologues. But mere talk would not

To show the subject in continuous motion, the "film" is punched and cut into separate pictures by a toesial device, and the cut pictures inserted into a booklet provided for the purpose. By running the booked pictures be tween the thumb and index finger, the illusion of motion is produced, as in the almost-forgotten Edison "mutoscopes" of the early nineties. The machine utilizes perforated paper of the same width as the regular motion-picture film. However, it is not restricted to the use of perforated paper: an additional device incorporated in the camera enables the operator to use plain paper at will, which, in many cases, is a desirable advantage.
