## Here and There

Immigration to Canada in 1925 totalled 84,907, of which 35,302 was contributed by the British Isles, 17,117 by the United States, and 32,828 by other countries. In addition 39,989 Canadians who had established homes in the United States and resided there for a period longer than six months returned to live in their native land.

A new cash-on-delivery parcels system has been inaugurated at Post Offices all over Great Britain. Parcels up to the value of \$40 (about \$195) may now be posted at any post office to any address in Great Britain, the value being collected by the Post Office authorities and remitted to the sender. The system seems to be meeting with success.

Business conditions on the Pacific Coast continue on the upward trend with great activity in construction work. The lumber industry outlook is brighter and there have been important developments in new saw-mill construction. The fishing industry is on a better footing, pulp and paper mills are active and additional power programmes are being worked out.

A. M. Johnson, President of the Canadian Club of Boston, visited Montreal for the first time on the new "Redwing" train now running between the two cities on Canadian Pacific lines. In telling of the charitable and naturalization aid given Canadians by the Canadian Club of Boston, Mr. Johnson said there were some 900,000 Canadians in the State of Massachusetts. Of this number 80,000 are in Boston.

Sir Esme Howard, British Ambassador to the United States, stated on his arrival in Toronto on a C.P.R. train that the question of European peace was the most urgent and immediate problem of the day. It was necessary for Great Britain to assist in maintaining peace and the League of Nations offered a suitable vehicle. Sir Esme claimed that if the League disappeared England would be compelled to join some European combination against any country which threatened to dominate the continent.

Net earnings of the Canadian Pacific Railway for March were \$2,824,177, an increase of \$706,965 over the same period last year, and the best March net since 1918. For the three months ending March 31 net earnings were \$8,531,007, an increase of \$2,875,385 over the corresponding period of last year and the best showing for the three months since 1917. Gross earnings for March were up \$1,330,271, while expenses increased only \$623,306.

The development of tourist traffic to the Dominion has been one of the most noteworthy events of the Canadian economic situation in the post-war period. Holiday makers of the United States apparently find Canada's vacation charm irresistible as the number of visitors shows large increases every year. In 1925 2,429,144 United States' automobiles entered Canada for touring purposes, as compared with 1,889,210 in 1924. A new record is expected this season.

## SPRING CROP OF CALVES

HOW TO RAISE BABY BEEF ON SKIM MILK.

Experiments at the O. A. C. Show You Can Do the Milking, Sell the Cream and Still Have a Good Calf. (Contributed by Ontario Department of Agriculture, Toronto.)

Many breeders of beef cattle prefer to hand-milk their cows and, with the growing demand for young and handy-weight beef, the question of the possibility of making baby beef on skim milk is a live one. Of course, no one will argue that better baby beef can be made with skim milk than with whole milk, but many believe it impossible to satisfactorily finish calves at baby beef age and weight without whole-milk for most of the feeding period.

An experiment with four good grade Shorthorn calves by a pure-bred bull and fed off with skim milk gave us some rather valuable results. The calves were put in in late January and February, 1924, and were marketed in late January, 1925, at just about twelve months old and at an average weight of approximately 300 pounds each. They graded very choice baby beef in carcass. They made a daily gain per steer of 1.961 pounds, a profit over cost of feed of \$54.85 and a profit of \$34.85 over all costs, including initial cost of calves. We were pleased indeed with the results. These were good cattle, finished ready for market at the popular weight and grade, had given good market prices for feed consumed and had taken practically no whole milk after the first three weeks of age. There are some possibilities in this direction, but good beef type calves are necessary to start with and more than the usual care in feeding is necessary. It would not be advisable to try it with dairy-bred stock and certainly care in feeding and housing are essential, but it looks possible to make fairly good baby beef from skim milk calves of the right type breeding if they are fed right and kept in the stable, preferably in box stalls.

### The Dairy Veal Calf.

Experiments have shown that dairy-bred steers and heifers are not suitable for beef production, so it becomes necessary to dispose of many calves from commercial milk-producing herds as well as cull calves from pure-bred herds. Most people do not like to destroy such calves at birth and so try to veal them off. While a dairy-bred calf does not make as good veal as a beef-bred calf, if he is to be eaten at all he is more likely to meet expenses and more nearly suit the consumer as veal than as any other kind of meat. With a number of calves in our own herd—Holsteins, Ayrshires and Jerseys—we found that calves 71 pounds on at birth, that in feeding for seven weeks it took 7.98 pounds of whole milk for a pound of gain in weight, and the work showed that the best way to handle such calves is to give them whole milk for the first three weeks of their lives and get them on the market as soon after that as possible, or, in other words, profits drop week by week in feeding whole milk to an average dairy-bred veal calf after he is three weeks of age, at which time he is marketable. Calves should, however, be put in the best possible condition if to be marketed at that age, as poor veal injures the market for all veal.—Dept. of Animal Husbandry, O. A. College.

### The Big Co-Op.

The Big Co-Op. can fix, and force buyers to accept fair and uniform grades; can establish its own brands and maintain an exclusive market for them through advertising.

The Big Co-Op. can develop new uses for a product; can find new markets where none existed previously; can usually find a sale for low grade products, without damaging the market for higher qualities.

The Big Co-Op. can make sure of the credit of the buyers, and fight fraud; and can establish retail outlets for its products when necessary.

The Big Co-Op. can blend and process the product, and collect the profits thereof.

The Big Co-Op. can demand and secure better railroad service, and the cheapest storage and insurance rates.

The Big Co-Op. can sometimes sell the product direct to the manufacturer, exporter, or retailer, reducing speculative danger and collecting the intermediate profit. A single farmer or a small Co-Op. can not do this.

### AN AID TO THE STAPLES.

When Fencing Rough Land Nick the Posts.

The up and down pull exerted on the staples used in keeping wire fencing in position is often so great as to loosen and extract the staples holding the wires to the posts on higher ground. A sagging fence is worse than useless as it tempts stock to go over and may cause them injury. All wires may be kept tight and in place by simply cutting a shallow notch in the post where the wires are to be held and then resting the wire on the shoulder of the notch. The post will then support the pull whether up or down, and the staple can do its part in holding the wire in to the post, all that a staple is intended to do.—L. Stevenson, Director of Extension, O. A. College.

### Canada Thistles.

The best way to kill Canada thistles is to use a short rotation of three or not more than four years, such as a grain crop seeded down with red or sweet clover, left one year to pasture or hay, followed by a hoe crop and sown with grain and reseeded. Timothy seed may be sown with the clover and it may be left in meadow two years. The clover plant does most of the work in smothering thistles and in being cut at a time that will be very hard on thistles. Being hollow, water goes in the stems causing decay.
