Here and There

More than 50,000 people will have visited St. Anne de Beaupre this year when the season ends. It is already an increase over last year when 304,322 persons visited this famous shrine. During the week ending August 22nd, 43,000 pilgrims visited St. Anne.

Halifax.—Considerable quantities of swordfish are being shipped from Nova Scotia to the Boston market at the present time. This commodity has found a good market in Boston and shipments to that city average around ten to fifteen thousand pounds a day during the shipping season.

September is becoming a popular month for marriages judging by the number of honeymoon couples leaving from Windsor Street Station, Montreal, recently. On Labor Day no less than 50 couples boarded the Canadian Pacific trains at this depot. The record established for one day, however, was some years ago in June when 70 couples left Windsor Station one morning.

The new North Channel below Quebec will be opened to navigation on June 1 next and continue during the high water season, according to a recent announcement of the Marine Department. The new channel extends in a straight line from St. Jean, Isle of Orleans, to near the north shore. The work has been underway for the past ten years. The minimum depth of water at high tide will be 35 feet. When all the work is done there will be the same minimum at low tide.

"The Little Red Schoolhouse" will be brought on rails to the children living in the remote areas along the Canadian Pacific in Northern Ontario between Sudbury and Chapleau. Fully equipped with desks and teachers' accommodations the railway cars will visit about six points a month. There are about 400 pupils in these areas of the North who suffer disadvantages from the lack of school accommodation. It is expected that eventually the entire area will be served by travelling schools.

Immigration to Canada in the first six months of 1926 amounted to 70,253, compared with 43,241 in the same period a year ago, an increase of 62 per cent., according to a statement issued by the Department of Immigration and Colonization. In the period under review British immigration increased from 20,452 to 27,949; immigration from the United States increased from 8,636 to 10,037 and from other countries increased from 14,753 to 32,367. Immigration for the month of June amounted to 12,191, an increase of 50% over June a year ago.

Saint John.—Representatives of Boards of Trade from all over the Dominion will gather here about the end of September of the middle of October for the first annual meeting of the Canadian Board of Trade. All three days are to be devoted to committee work on the larger questions of importance to the country at this time, including cost of government, immigration, taxation problems, preservation of the identity of Canadian grain, industrial research, trade and commerce, domestic and export, and particular attention is to be given to some system of facilitating inter-provincial trade.

Eight Pacific type locomotives, known as the G-3-d class and similar in general design to the well known 2,300 series Pacific class locomotive of the Canadian Pacific Railway, have been delivered to the Company. They are part of an order of 24 of these locomotives. By a special application of superheaters, greater power is developed. Delivery has also been commenced on an order of twenty Mikado type locomotives of the 5,300 type which have the same improvements. Both class of engine are part of the general equipment for which a provision of \$14,794,540 was made in the last annual report of the Company.

SAVING SILO FODDERS

HOW TO CONTROL FERMENTATIVE ACTION IN THE SILO.

Use Lactic Acid Culture. But Only If Needed—Moisture In Silage Making—Weeds—Corn as a Fodder Crop.

(Contributed by Ontario Department of Agriculture, Toronto.)

Attempts have been made to control or direct the fermentative action within the silo. The lactic acid bacteria (bacillus lactic acid) has long been known to be beneficial in silage making, and its product, lactic acid, is found to the extent of one per cent. in well-made silage.

Experience has demonstrated that the addition of bacillus lactic acid in quantity to the fodder as the silage was being filled gave good results, particularly so when the fodder was just the best stage for making high grade silage. The addition of the bacillus lactic acid in quantity to the more or less spoiled fodder provides an active agent to check and override the other bacteria present and thereby control the fermentative process and bring the silage mass to a fairly uniform condition with lactic acid predominant in the silage.

This addition of lactic acid culture to the fodder at the time of silo filling is easily accomplished by securing a small quantity of pure culture for lactic acid from a creamery as a beginning. The pure culture is placed in a three-gallon can of clean skim milk and allowed to ripen for three days. This can be added to more skim milk and a quantity of culture developed that there may be at least one gallon for each ton of fodder that goes into the silo. This skim milk culture, carrying vast numbers of bacillus lactic acid is sprinkled over the cut fodder as the silo filling proceeds.

Do Not Use Oakum Unnecessarily. If the corn is in prime condition for silage making at the time of ensiling, nothing is to be gained by adding culture. However, its use is strongly advised if the corn or other fodder is a bit off in condition, due to damage through unreasonable weather, delays, etc.—L. Stevenson, Dept. of Extension, O. A. C., Guelph.

Moisture In Fodder for Silos. It is essential that there should be sufficient moisture present in fodder at the time it is being placed in the silo to provide the water requirement for the ensiling process and leave the surplus necessary to have amply moist, well made silage after the fermentative and cooling processes have taken place. With sufficient moisture present in the ensiled mass there is little danger of the fermentation temperatures running too high. Corn in the glazed stage or dried out through freezing, or long delays in harvesting will require liberal wetting. The shortage in plant juices can be made up by the application of water in quantity sufficient to thoroughly wet the cut fodder. Water is best applied by running a small stream directly into the fodder cutter while the fodder is being passed through and blown up into the silo. With water under pressure, a valve to control the flow, and a section of garden hose the process of wetting the cut fodder is easy.—L. Stevenson, O. A. C., Guelph.

Weeds. The crop producing capacity of many an acre in Ontario has during the past season been reduced by twenty-five per cent. This is too heavy a charge against the land and only the rich fellows can stand the losses occasioned by weeds.

Keep weeds off the farm by ploughing all the land that you intend to plough immediately after harvest. Cultivate as frequently as possible with the springtooth up to the end of October. In early November rib up the land that the weed roots may be exposed to the weather. Ribbing attachments can be placed on the springtooth cultivator which makes it possible to cover a large area in a day.

Insist on careful cleaning of the threshing machine before it comes to your farm. See that all farm machinery is free from the roots of perennial weeds before going to another field.

Use only clean seed. A few thistle seed balls or couch grass seeds will add to and multiply your troubles in future years, so be sure that you sow wheat and nothing but wheat.—Dept. of Extension, O. A. C., Guelph.

Corn. The unusual weather conditions that have been experienced in southwestern Ontario this year emphasize the value of the corn plant as a fodder crop to a greater extent than in recent years. Corn will fill the silos as in past years even if the hay crops have failed to fill the barns. If it were not for corn many farms would be short of cattle feed for the coming winter. Corn is certainly worth retaining as a crop for Ontario stock farms. There is no real substitute. Do your duty in creating conditions unfavorable to the corn borer, and so drive the menace to corn from Ontario. Handle the crop. Plough the stubble under and keep it under.

The Profitable Hen. It is not always the hen that lays the most eggs that is most profitable. It is the hen that lays the most eggs when prices are highest that shows the highest profit. In one of the laying competition a hen that stood fifth in the number of eggs she laid stood first in the value of her eggs.
