

### Greenland Ice Cap Land of Adventure

Greenland, which has always attracted man's curiosity, has become in the last few years a hunting ground for the scientist and the aviator. Writes Russell Owen in the N.Y. Times. In the last two or three years men have gone there to study meteorological phenomena, and have even lived inland under conditions of almost unbearable hardship that they might learn something of the effect of Greenland's winds upon the world's weather, or to ascertain if the island is a suitable link in an airplane route from Europe to Canada.

The great ice island has always been a mystery, a lot of the ice has remained close to civilization.

#### THEORY OF CONTINENTAL DRIFT

The Wegener expedition went to Greenland to make the most elaborate examination that has yet been made of the interior of the island. Alfred Wegener, its leader, believed that Greenland was moving westward and that if he could prove this it would go far to uphold his theory of continental drift—that is, the theory that the continents were once a single land mass and drifted into their present positions. He also planned to investigate the weather in the interior of Michigan had first done on the west.

Three stations were established, one at the middle of the ice cap, the most desolate meteorological station ever built, and one on each side of the ice cap near the coast. The central station was to be manned during the winter by Dr. Johannes Georgi and Dr. Ernst Sorge. However, early last September, according to the report that reached this country they sent out word that they would leave on Oct. 20 for the provisions. Wegener, with Dr. Fritz Loeve, and thirteen Eskimos, started inland with two tons of provisions. The trail to the central station had been carefully marked on previous trips with black flags. It was late in the season for a journey, and the going became a matter of hardship, in blizzards and snow, until all the Eskimos but Rasmus had turned back. Mile after mile Wegener struggled on, determined that he would carry sufficient food through to relieve his men, and also that the year's observations, and the preparations had already been so painful, should not be lost.

Oct. 20 came, and still Wegener kept going, not knowing that the intense cold of 65 degrees below zero had proved more of a deterrent to his inland companion than the shortage of food. He had to drop part of his supplies along the route, caching them in snow caves. In such intense cold his snow becomes like sand and it is almost impossible to find a sled. Dogs' lungs become frost-bitten and the dogs die. Vitality is sapped until every movement becomes one of infinite labor. Hands and feet and faces are continually frosted, and a sleeping bag becomes a frozen mass of fur into which a man wedges himself with difficulty to obtain very little sleep.

Sometimes Wegener made only two or three miles a day. He carried his last of his provisions six miles from the central station and he and Loeve and Rasmus staggered in exhausted. Loeve's feet were frozen so badly that he could not return, but when it was determined that there was food enough to last three men all winter, a reckoning that has not been reconciled with the reported reason for the journey—Wegener and Rasmus started back to the west coast. Wegener had to go to the west coast, more or less, than Scott's men, Wilson, Bowers and Cherry-Garrard, made their historic trek in search of peering eggs. Wegener had to go a much longer distance, however, and both he and Rasmus were tired out before they started.

He never reached the coast. The next spring when the men at the central station were relieved they learned for the first time that Wegener was missing. They had hoped he was safe. Later they found his ski sticks 122 miles from the central station, more than half his distance to safety. He had made this incredible march with little food, in the midst of winter weather, with his feet and hands buried under the ice cap, but his strength had not been equal to going the whole route. Rasmus, his faithful companion, had sewed his body in blankets, covered it with fur coats and buried himself in the snow. The rescue party found it there and after placing it on the sled, which was found forty-two miles further inland, buried it again in its last resting place on the ice which Wegener had traversed so many times. Rasmus was never found. Some deep crevasses probably hold his body.

Concerning the situation as to food Dr. Georgi, sending out word from the central station last May, said: "Provisions we had in ample quantity. Even the addition of Dr. Loeve caused no shortage, since each of the eight rations provided could be stretched to a third more." So there remains confusion as to the reason for Wegener's trip. The station ran short of fuel, however, and the temperature in the snow but varied from freezing below zero at the ceiling to 4 in. below zero at the floor. At table or at work the men had to sit in their sleeping bags.

### Off the Coast of Devon

In contrast with this unfortunate end of Wegener is the experience of Augustus Courtauld of the British Arctic Air Route Expedition, who spent five months alone in a tent on the inland ice cap and came out none the worse for his experiences. The worst temperature he recorded was 64 degrees below zero, which is milder than had been expected in the interior of Greenland. But what Greenlanders in cold it makes up in wind and snow. Courtauld was buried so deeply when found that his rescuers had to dig him out.

Courtauld's experience was due to the fact that the party sent to the inland station of the British expedition was delayed so much by the weather that when they arrived there it was evident that only one man could possibly remain and live on the food on the food which could be cached. So Courtauld stayed to keep perhaps the loneliest vigil the Arctic has known, at least in connection with an expedition. He did not mind it much.

"Many people might imagine that I was bored living in an entirely novel life under such interesting conditions. My physical and mental condition, the weather, speculation about things of friends at home were subjects which fully occupied my mind. I never had the slightest doubt with regard to my relief, though I fully realized it might be delayed."

Such things men in Greenland are undergoing that they may learn something of Greenland's weather and its effect upon the world, and Greenland's variability are herewith stated. The new explorers have not dared more than the men who first crossed the inland ice, but they have kept persistently at their work in the face of appalling difficulties. They have been very successful in their work, and their reports are of great value. Even now a Danish expedition is being prepared which will spend two or three years in Greenland, carrying on and extending the work; it seems probable that within a short time there will be little of Greenland unknown except what lies beneath its magnificent sheet of ice.

**The King's Example**  
Quebec Sole (Lib): The King has just given a splendid example of economy to the British people by reducing his civil list \$250,000. This sum will remain in the Treasury and will contribute towards the financing of the Budget. Most of all it will be a lesson to a host of lucky people and will show them that, in these depressing days, they, too, should save a part of their money to the success of the unlucky. We live in a time when all those who possess great fortunes should be especially anxious to do their share of the good work, to the relief of the lot of the people. The excessive prolongation of the present crisis makes it more imperative that those who possess great fortunes should do their share of the good work, to the relief of the lot of the people. The excessive prolongation of the present crisis makes it more imperative that those who possess great fortunes should do their share of the good work, to the relief of the lot of the people.

**The Mark of the Lion**  
All was quiet and peaceful in the little country village. Suddenly a high-powered car burst into view. From one side of the road the driver plied along the route, catching them in snow caves. In such intense cold his snow becomes like sand and it is almost impossible to find a sled. Dogs' lungs become frost-bitten and the dogs die. Vitality is sapped until every movement becomes one of infinite labor. Hands and feet and faces are continually frosted, and a sleeping bag becomes a frozen mass of fur into which a man wedges himself with difficulty to obtain very little sleep.

**Living Cost Drops 27 P.C. in Denmark**  
Copenhagen—Danish housewives have profited by a 2 per cent. fall in the price of food, clothes, shoes and coal here within the last few months. Compared with July, 1930, prices for these commodities are down 27 per cent. A decrease of about 20 per cent. in retail prices between 1929 and 1930 brought the Danish cities in the cost of living down to approximately 27 per cent.

**Western Canada's Wheat**  
Winnipeg, Man.—The wheat crop of the prairie provinces is estimated at 254,250,000 bushels in the annual estimate of the Manitoba Free Press published recently. The figure shows 27,522,000 bushels for Manitoba, 117,585,000 for Saskatchewan and 109,723,000 for Alberta.

**Amy Johnson Home Again**  
Lynchburg, Va.—Amy Johnson reached here last Wednesday night after a long and arduous round trip during which she was frozen to the bone. The temperature in the snow but varied from freezing below zero at the ceiling to 4 in. below zero at the floor. At

### Fall Gardening

(By Jeanette Leader)  
Fall is the time to plant bulbs in your garden and in pots for decorating your rooms during the winter months. Every available space should be used in the garden for Hyacinths, daffodils, narcissi, tulips, crocus, lilies, peonies and other spring flowering bulbs. They are inexpensive and many of them once planted come up every year after.

The soil needs not be very rich, any soil that is well worked and has a suitable. No fertilizer should be used any bulb or plant and too much is a worse than not enough. Good drainage is very important. Bulbs will rot if planted where water lingers during the winter. A layer of sand directly under the bulb is advised, if possible. Hyacinths should be planted five inches deep, tulips and daffodils four inches below the surface of the ground, and the smaller bulbs about two inches deep. Lily bulbs need six inches or more depth. It is not necessary to mulch the bulbs. If they are done the tender shoots will be saved in trying to push through when the mulch is removed very early in the spring.

Pleasant effects may be produced in planting bulbs in strategic places in the garden. Beds of all colors are striking; especially is this true in the case of a bed of light red tulips. It is much better to plant only one or two colors in a bed but in the case of clumps of different kinds are effective. Do not mix varieties of the same color. The fall when time is spent in the garden is a time when the mind is free from the cares of the day. It is a time when the mind is free from the cares of the day. It is a time when the mind is free from the cares of the day.

**Fish Catch Larger But Value Is Less**  
Canada's landings of one fish for the first half of the current year were larger by about 767,000 pounds than in the first half of 1930. The catch was a record 3,810,000 pounds in the first six months of the present year, says a recent bulletin, was 303,351,800 pounds as compared with 302,584,200 pounds in the first six months of 1930.

Owing, however, to the general decrease in prices, the landed value of the catch for the six months was lower this year than last, totaling a little less than \$6,113,000, as compared with \$9,501,000. While the landed values decreased, so far as catch was concerned there was an increase of more than 3,000,000 pounds in the case of British Columbia and of more than 6,000,000 pounds in the case of Quebec, while Prince Edward Island landings were 100 per cent. above the 1930 landings for that province. The Newfoundland catch showed a drop of about 1,800,000 pounds while the landings in Nova Scotia were 7,300,000 pounds lower than a year ago.

As summed the different varieties of fish the increased landings were in cod, herring, smelts and salmon. The lobster catch totaled 24,936,000 pounds as against 24,285,700 pounds in the first half of last year. The salmon catch in British Columbia was a record year in the history of Pacific coast fisheries. Up to July 1931 the pack of British Columbia salmon was slightly above 100,000 cases. In 1930 the output up to July 12 was 137,363. The salmon caught in British Columbia in 1930 numbered nearly 37,000,000. The highest previous number reported was 24,500,000 in 1926.

**A Sheer Escape**  
It was the firm's annual dance. The young bookkeeper had chosen a very attractive lady partner. "By the way," he volunteered as they danced, "do you know that dot, the manager?" His partner made no reply. "He's about the dumbest half-witted 'I've ever seen,'" he yowled continued. She stopped dancing and stared hard at her partner. "You know who I am?" "Not the faintest dot," he said, lightly enough. "Well, I'm the manager's wife," she informed him.

**Suitably Named**  
The young poet hurried his latest effort to the busy editor. "The latter read it hurriedly. "You haven't put a title on it," he said. "What do you propose to call it?" "My birthday," said the poet, proudly enough. The editor handed him the MS. "There," he said, "it's your own happy return."

**Heard in the Suburbs**  
They were making out their weekly budget. When it had been settled to their satisfaction he leaned back in his chair and breathed a sigh of relief. "Anyway, dear," he said, "there's one thing we ought to be thankful for." "What do you mean, Henry?" she asked wonderingly. "That our friends haven't got the things we can't afford," he explained.

### Greenland Ice Cap

Greenland, which has always attracted man's curiosity, has become in the last few years a hunting ground for the scientist and the aviator. Writes Russell Owen in the N.Y. Times. In the last two or three years men have gone there to study meteorological phenomena, and have even lived inland under conditions of almost unbearable hardship that they might learn something of the effect of Greenland's winds upon the world's weather, or to ascertain if the island is a suitable link in an airplane route from Europe to Canada.

In the last two or three years men have gone there to study meteorological phenomena, and have even lived inland under conditions of almost unbearable hardship that they might learn something of the effect of Greenland's winds upon the world's weather, or to ascertain if the island is a suitable link in an airplane route from Europe to Canada.

#### THEORY OF CONTINENTAL DRIFT

The Wegener expedition went to Greenland to make the most elaborate examination that has yet been made of the interior of the island. Alfred Wegener, its leader, believed that Greenland was moving westward and that if he could prove this it would go far to uphold his theory of continental drift—that is, the theory that the continents were once a single land mass and drifted into their present positions. He also planned to investigate the weather in the interior of Michigan had first done on the west.

Three stations were established, one at the middle of the ice cap, the most desolate meteorological station ever built, and one on each side of the ice cap near the coast. The central station was to be manned during the winter by Dr. Johannes Georgi and Dr. Ernst Sorge. However, early last September, according to the report that reached this country they sent out word that they would leave on Oct. 20 for the provisions. Wegener, with Dr. Fritz Loeve, and thirteen Eskimos, started inland with two tons of provisions. The trail to the central station had been carefully marked on previous trips with black flags. It was late in the season for a journey, and the going became a matter of hardship, in blizzards and snow, until all the Eskimos but Rasmus had turned back. Mile after mile Wegener struggled on, determined that he would carry sufficient food through to relieve his men, and also that the year's observations, and the preparations had already been so painful, should not be lost.

Oct. 20 came, and still Wegener kept going, not knowing that the intense cold of 65 degrees below zero had proved more of a deterrent to his inland companion than the shortage of food. He had to drop part of his supplies along the route, caching them in snow caves. In such intense cold his snow becomes like sand and it is almost impossible to find a sled. Dogs' lungs become frost-bitten and the dogs die. Vitality is sapped until every movement becomes one of infinite labor. Hands and feet and faces are continually frosted, and a sleeping bag becomes a frozen mass of fur into which a man wedges himself with difficulty to obtain very little sleep.

Sometimes Wegener made only two or three miles a day. He carried his last of his provisions six miles from the central station and he and Loeve and Rasmus staggered in exhausted. Loeve's feet were frozen so badly that he could not return, but when it was determined that there was food enough to last three men all winter, a reckoning that has not been reconciled with the reported reason for the journey—Wegener and Rasmus started back to the west coast. Wegener had to go to the west coast, more or less, than Scott's men, Wilson, Bowers and Cherry-Garrard, made their historic trek in search of peering eggs. Wegener had to go a much longer distance, however, and both he and Rasmus were tired out before they started.

He never reached the coast. The next spring when the men at the central station were relieved they learned for the first time that Wegener was missing. They had hoped he was safe. Later they found his ski sticks 122 miles from the central station, more than half his distance to safety. He had made this incredible march with little food, in the midst of winter weather, with his feet and hands buried under the ice cap, but his strength had not been equal to going the whole route. Rasmus, his faithful companion, had sewed his body in blankets, covered it with fur coats and buried himself in the snow. The rescue party found it there and after placing it on the sled, which was found forty-two miles further inland, buried it again in its last resting place on the ice which Wegener had traversed so many times. Rasmus was never found. Some deep crevasses probably hold his body.

Concerning the situation as to food Dr. Georgi, sending out word from the central station last May, said: "Provisions we had in ample quantity. Even the addition of Dr. Loeve caused no shortage, since each of the eight rations provided could be stretched to a third more." So there remains confusion as to the reason for Wegener's trip. The station ran short of fuel, however, and the temperature in the snow but varied from freezing below zero at the ceiling to 4 in. below zero at the floor. At

**Living Cost Drops 27 P.C. in Denmark**  
Copenhagen—Danish housewives have profited by a 2 per cent. fall in the price of food, clothes, shoes and coal here within the last few months. Compared with July, 1930, prices for these commodities are down 27 per cent. A decrease of about 20 per cent. in retail prices between 1929 and 1930 brought the Danish cities in the cost of living down to approximately 27 per cent.

**Western Canada's Wheat**  
Winnipeg, Man.—The wheat crop of the prairie provinces is estimated at 254,250,000 bushels in the annual estimate of the Manitoba Free Press published recently. The figure shows 27,522,000 bushels for Manitoba, 117,585,000 for Saskatchewan and 109,723,000 for Alberta.
