Steps Forward Again

As usual, John Bull has taken the initiative in showing good faith toward his obligations by a tentative arrangement for payment to the United States of war debts deferred during the past year. The Hoover moratorium applied to all debtor nations, but none except Britain, so far, has come forward to make a settlement, as she was also first to make the original war-debts settlement. Her compression at the settlement of the settlem first to make the original war-debts settlement. Her arrangement at that time was the most costly of all, and the present proposal, rather than bringing relief, increases the expense. The interest rate is 4 per cent. instead of 3, and if the pound remains at less than the properties the pound remains at less than the properties the p par when the money is forwarded the nent in pounds will be that much

The fact that Britain's arrangen is conditional does not alter the prinbe found to wipe out all war debts or adjust them to prevailing conditions. Payment of arrears will depend upon dian product by an aboriginal Cana-Bull has let it become known that he will follow his traditional policy of review in the Sunday edition of the neeting obigations, no matter how hurts.-Toronto Mail and Empire.

The New Zealand Treaty

Any treaty or trade arrangemen that gives Canada a preference in \$200,000,000 a year market cannot bu be a good thing for Canada. That i what has happened in the case of th new treaty entered into with New Zea land, and the consequences are bound to be beneficial.—Ottawa Journal.

New Knowledge to Man

At the Zeiss works in Jena, Germany, Dr. Cohn has collected the rays of the sun in a mirror and focused them on some zirconium oxide, which melted at 5,432 degrees Fahrenheit. Encouraged by this success, Dr. Anderson of Mount Wilson Observatory is now constructin a gigantic solar furnace composed of nineteen burning-glasses, each two feet in diameter. With this system he hopes to attain a temperature of 10.000 degrees Fahrenheit.

Investigations of this type are necessary if we are ever to solve the problems presented by matter. We live in a world of low temperature. New worlds, one after another, are zevealed as normal temperature by 100 degrees and even less. If water can be changed into steam by a rise of temperature to 212 degrees Fahrenheit, and iron becomes an incandescent liquid when it is melted at 1,500 degrees Centigrade (2,786 degrees Fahrenheit), what would happen at 10,000 degrees Fahrenheit?

As the temperature rises, matter.
