Martin Company's Baltimore laboratory perfected a jelly-like emulsion which, when melted, may be applied to the wall surface with a brush, sponge or rag. When it dries, the negative is held against this sensitized surface, light is applied and development of the picture proceeds normally. The entire operation is carried out under darkroom conditions, with ruby light. Above, an operator is making a print on a wall.

Of course, I suppose Big Business, in the form of large distributors, would be the bottleneck to the little solution I have mentioned. Naturally there would be less milk for sale—but there might also be less wasted if the supply were to comment on its poor work-manship. But now I buy a thing like that—and try not to look at it at all. What burns me up is the fact that the manuacturers have their finger on the public pulse, as

it were, and know just what they can get away with. And I suppose can get away with. And I suppose as long as there is more money than merchandise the public will continue to be exploited. When manufacturers find goods harder to sell then competition will be keener, each one will try to do a little better than the other in order to make his goods more attractive and of better quality.
