Royalty Has Its **Awkward Moments**

How would you like to catch your heel in a rut and take a tumble under the gaze of thousands of people? If you were the leading gure of some stately ceres how would you like to have your hat blown friskily away by the wind amid a concourse of staid

These are just two sample nightmares amid the awkward moments that constantly threaten royalty— and both have come horribly true in recent months. The Queen had the ill-luck to fall in the muddy Regaining her feet, she smiled at the onlookers with a cool composure that admirably concealed he

real deelings. And Princess Elizabeth had to chase after her hat while leaving a church ceremony and fortunately caught it before it had flown too . Though such a serial crisis has never occurred before to any of the royal ladies, it's always among the ever-threatening possi-

Stockings Switch

Sepping from an armoured car in which she drove to a military show, the Queen once laddered her stocking from top to bottom. She gave the offending vehicle a truly feminine look of disgust, yet within a few minutes Her Majesty was

again immaculately hosed-Few onlookers noticed that the lady-in-waiting no longer wore stockings. Ever since this occa sion attendant ladies have always carried a spare pair-of the royal size-in their handbags!

Then there was the contretemps when Queen Mary entered a de-monstration room at an exhibition to test a robot doorlock operated by the invisible ray of an electric selenium cell. Just at that moment, something went wrong with the apparatus and Her Majesty was locked in.

What Queen Mary said was never reported. But her partner n this inadvertent imprisonment, Sir Stafford Cripps, subsequently gave evidence on the incident in Court, when a purchasing company and the parent selenium company were involved in the dispute.

That such a trivial misadventure can prove so momentous often heightens royal embarrassment. A year or two ago Princess Elizabeth was reviewing a Women's Army Corps battalion at Shrewsbury when a sergeant of her guard of honour fainted almost at her feet. With military precision the others in line still stood rigidly at attention. Almost before the Princess could glance around, ambulance girls were dashing across the field.

America Shocked Unhappily, just at that moment, cameraman took a peculiarly unkind shot. When the photograph was recently published in America's foremost picture magazine public opinion was shocked. Since the ambulance girls are not in the piccess Elizabeth seems to coldly ignoring the prostrate

girl. The camera has seldom lied so With any royal mishap always liable to distortion in this way, it is small wonder if Court officials cling to the motto: "You can't be too careful!" Queen Victoria once pricked her finger on a table fork. To this day Palace forks are placed point downward, not as a tradition, but lest a fork-prick should set up blood-poisoning in some visiting

Royal faces are sometimes red, in fact, but every member of the royal family is keenly and sadly aware that fluster and awkwardness are generally on the other side. Nerves can reach such a pitch that a business man who had an audience with the Queen once collapsed with a heart attack in her presence. t one of the early engagemen of her career Princess Margaret was so stricken with nerves that she nearly fainted.

Sheep For Geiger Counting-These ewes are part of a herd being used in experimental work at the Hanford Atomic Energy Works. Their diet consists of alfalfa, grain and food pellets, as well as radioactive iodine enabling scientists to determine how radio-activity affects living conditions. At right a scientist starts to count sheep—with a Geiger counter.

SPORTS &

Well, it locks more or less like hash today. Also, with the butcher's price list more and more resembling the temperature chart of a patient running a burning fever, even hash is liable to be diluted in times such as these. Like the beanery chef who, when asked his recipe for making chicken soup, replied "Fifty-fifty-one barrel of water, one of chicken." /

To start off with something of very small interest, did you know that entries for the 1951 English Channel Swim, sponsored by the Fondon Daily Mail, have arrived from no less than 70 challengers coming from 21 different countries? This proves, if anything, that a certain sort of goofiness is by no means local, but spread far and * * *

France tops the list with 13 men and a girl typist from Paris. And in case you're thinking of holding your breath waiting for the results our advice is against it, as the race won't be held until August 13. By that time the total number of competitors will be probably whittled down to a mere 20. If it were whittled down by another score we, personally, think we could stand it. | made since then by hopefuls of all

ISSUE 25 - 1951

That's a question many folks would like to have answered definitely.

Some people believe that charcoal will improve the health and reduce the mortality rate of chick ens. The information given here will give you some idea of the el fect adsorbing (sticking of gases or dissolved sdbstances to the sur face of solid hodies) charcoals may have when fed to chicks .-

H. J. Almquist and D. Zander research workers, conducted some experiments a few years ago in which they added an adsorbing charcoal to the diet of certain lots of chickens. Their objective was o determine, if possible, the effect of adsorbtive charcoal.

These two workers point out in their report that charcoal is claim ed to act by adsorbing undesirable products from the digestive tract. In fact, they state that one manufacturer of poultry charcoal lists the following substances as removed: carbon dioxide, ammonia bacteria, pigments, poisons, and

The workers knew that feeding charcoal would cause poultry flesh and egg yolk color to bleach by reducing the deposition of certain yellow pigments from the diet. This bleaching effect suggested that carotene and other vitamins in the die might also be removed or inactivated by charcoal. Previous work had already shown that vitamin K was adsorbed strongly on charcoal,

So, in setting up their study. Almquist and Zander formulated a diet which would provide favorable amounts of vitamins A, K. G. (riboflavin), and the chick anti-gizzard erosion factor. The diet was found capable of promoting normal growth and health of chicks. They fed this diet with and without 2 per cent of an adsorbing charcoal to day-

In the lot of 20 chicks fed the diet to which charcoal had been added, growth was not too good, there were 15 cases of vitamin A deficiency, blood-clotting time was increased to more than 30 minute and all of the chicks had eroded gizzard linings. In the lot of 20 Succeeding experiments were perchickens fed the same diet but

The group were en-route to the United Kingdom to attend the Highland Show at Aberdeen and the Royal Show at Cambridge where they were to be judges of livestock. The boys, who will be away for six weeks, were selected for the trip on the basis of their judgeability in previous competitions in Canada. Left to right: Mr. Hilliard, Wallace Cavanagh, of Kinburn; Murray Sewell, of Markdale; Howard Scott, Bridgen; and Carl Boynton, Woodbridge.

without charcoal, growth was good, there were no cases of vitamin A deficiency, blood-clotting time was only 2.4 minutes and all gizzard linings were normal.

A second experiment was performed in which a second sample of adsorbing charcoal was tested. In this test no vitamin A deficiency is noticed. The charcoal group did, however, require a longer time for blood-clotting and showed moderate gizzard erosion. "Curled-toe paralysis," a sympton of vitamin G (riboflavin) deficiency, was also noticed in the charcoal group. The different results obtained in the first and second experiments were believed by Almquist and Zander to be due to differences in reserve stores of vitamins in the different

stricta) makes a still more formal edging. The silvery blue grass (Festuca glauca) is distinctive in both form and color at the edge of a flower border. For flowers along the edge itself, coralbells (Heu-chera sanguinea) are a delight each spring, and the scalloped leaves are attractive all season. With a perennial planting it still is necessary to cut a well-defined edge to the garden. That is, it a trim appearance is to be achiev d

whose small, dark, evergreen leaver

give it always a neat appearance

If it seems more desirable to vary the type and colour of the edging plants from year to year, bedding plants or annuals may be used in place of perennials. Bedding plants gain their effect pri-marily from the color of their foliage, thus presenting an interest-ing change from the usual annual wers. Telanthera (or alternan thera) provides a neat edging and its species and varieties offer dif and variegated iolage, aureanana for yellow, versicolor for copper tones. The bloodleaf (Iresine lindeni) is useful where dark is de ired. Yellow may be obtained with the Golden Bedder variety of colus. The neutral gray of lavendercotton (Sastolina chamae-cyparis-sus) and of dusty miller (Centaurea candidissima) will help to blend the foliage plants tend to give a formal Victorian air to a garden bed.

The low-growing annual plants are best for changing a dull gar-den edge into one of bright, over-flowing color. Annuals are so pro-.fuse in their blossoming that, once they start, they provide a mass of color all summer long. There are endless possibilities in form and color for edging. If a neat, formal border is desired, there are the low-growing compact, dependable plants, like lobelia and ageratum that will remain uniformly in their place all season. For more gay effect, there is the exuberant portulaca that will overrun the edge of the sunny border with its vivid
