Prince Charles Won't Be Pampered

swinging hand over hand along a rope thirty feet over a lake, water ducking but the strength of their own muscles and a measure of cat-like skill.

Well, that's the kind of thing Prince Charles will do when he begins school as a new boy at Gordonstoun.

There'll be nothing cushy for him at the extraordinary Scottish school where his father was

Out of bed at dawn, a quick freeze under a cold shower, a run round the grounds before breakfast trying to reach peak athletic speeds. Then making his bed, cleaning

his shoes and doing part of the housework - this is the toughening prospect for the teenager who will one day be King of No Palace official has con-

firmed that the heir to the throne will be going to Gordon-

But in Royal circles it is well known that Prince Philip intends to let his son follow in his athletic footsteps. Some true blues may have doubts about sending the Prince of Wales to a school where games, as a headmaster said, "have been de-

Yet Dr. Kurt Hahn, the school's German founder, drew his ideas from a school run by Prince Philip's uncle. Prince Philip went to Salem before joining the first contin-

gent of forty boys who switched to Gordonstoun. Curiously, Gordonstoun is the most expensive school in Scotland and yet parents fix their own fees. They are asked to decide what they can afford to pay, from £37 a term upwards. The Queen can pay up to £519 a year for Charles. But scores of boys get in cheaply on schol-

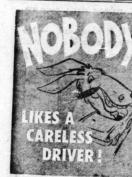

arships. Prince Charles may thus chum up with a miner's or shopkeep-er's son, or a boy from one of the poorer regions of industry. any case, he will mix with the local day-boys, sons of farmers and fishermen and railwaymen, boys from all strata of so-

Prince Philip joined the local coastguards, spending his quota of four hours on chilly watch Charles may prefer the Gordonstoun fire brigade, founded since his father's day.

Later on, if he takes after his father, Prince Charles might become an athletics coach at some of the local schools, rushing off to his own physical training groups on a bicycle. In Duffus village the local smithy is manned entirely by Gordonstoun youngsters. Farm-

ers may one day have cause to oint out machinery repaired by the Prince of Wales.

ong more menial tasks Prince Charles might well find himself fixing a soot plate in a

chimney stack or carrying out small local plumbing repairs. "To free the sons of the rich and powerful of the enervating sense of privilege," is still among Cordonstoun's avowed aims. Cheam Prep. School cast a

sense of exclusiveness around the young Prince, but his Scottish school will adopt the attitude that he's just as good as

In physical training, for instance, Gordonstoun boys are each encouraged to beat their own previous best, and not to compete against each other,

Two years from now, if h takes after his father, Charles will be able to walk five miles in an hour, run two miles is thirteen minutes and do the 100 yards in 12.6 seconds. At worst, he won't be far be-

Training Plan, as it is called ously tick whether he has kept certain rules. Has he rationed the time spent

istening to radio or watching TV? Can he satisfactorily tick that he hasn't "chewed" between

Yet this lesson in self-reliance is necessary before he can become a Room Leader, or climb the rungs of the ladder to become a Colour Bearer and, finally, Guardian, the highest honour of the school. Twice a week Prince Charles will enjoy a half-day given over to a project of his own choice.

It may range from making a kitchen table alone in the carpentry shop, to joining others in planting a new woodland. Prince Philip specialized in making architectural or ship models, a hobby he still enjoys on rainy afternoons at Balmoral or Sandringham. The choice for Prince Charles

will now be wider than it used to be. He can paint a picture in the art room or carve new pews for the chapel. Perhaps he will pick up his Uncle Tony's flair for photography or furniture design.

often urged that Prince Charles should travel abroad, sharing one of his mother's overseas

member of the ship's crew, just What Charles will do at Gor-

donstoun, in fact, is have the time of his life and have the Palace gloss scraped off him. The Queen fully understands the Gordonstoun system of turning a boy into a self-possessed man and won't be surprised if at Balmoral, hav-

ing walked all the way. discomfort, mockery . . deal with the unexpected Fighting Spirit . ever undergone training on this

A rise in the water hey really weren't superstitions. would leave two or three feet of thin ice near shore to be bridge f years of New England weather ed with planks, clothing got wet purposes we liked best

and sogy, and men got chilly and morose, writes Elizabeth Hay-ward Gardner in the Christian Science Monitor. The high point of the day was reached at 12 o'clock. The men knocked off work; bits were re-moved from the horse's mouths and feed bags tied on. Man and beast alike needed respite. The men trooped somewhat

self-consciously into the old kit-chen where my mother had been busily at work all morning A little sheepishly they dipped hot water from the copper broiler built into the back of the big tove, washed at the old iron sink and made a stab with a comb or a brush at the mirrored wall pocket. Bashfully they filed into the Middle Room where the long table waited. Martin Hayward never had any trouble getting men to harvest the ice (though it was a job not well liked by teamsters).

His wife always had a dinner they remembered from year to year. I can smell now the mouthwatering odors, see the long table with its snow white cloth, the English china with its brown Chinese pagoda pattern, and live over again the pleasure my mother took in feeding twentyfive hungry men.
Four big chines of fresh pork

came from the oven, roasted to a tender golden brown perfection, quarts of good golden gravy for the snowy potatoes bursting their brown jackets, winter squash, brown jackets, winter squasi, savory onions, fresh-baked bread or, better still, raised biscuits with generous slabs of butter, pickles sweet and pickles sour, chili sauce, piccalilli, apple, grape and barberry jelly from the cel-lar shelves. And for dessert the old New England standby no one could make better than my mother—berry slump, a steamed pudding swimming in blue-berries, drowned in vanilla sauce. To balance the sweet a glass of cold apple cider from the barrel in the cellar. No man got up from that table hungry.

The bells again began their gay chimes as the endless pro-cession of iceladen sleds moved once more. As the evening star blossomed

forth in the sunset sky the men once more trooped into the kitchen for the final act in the icing day parade—the pay. Then the crew of tired but happy men followed their bells down the hill and homeward. The great day we had all been waiting for was over. The ice crop was housed for another year. We were assured of the means to

too heavy, and the weight lifted the cub off the ground, with the little one trailing behind in Dallas, Tex.

END OF THE ROAD.—The main highway between Areo and Blackfoot, Idaho, was cut by flood waters. The Northern Rocky Mountain's worst floods in memory have left 6,000 persons homeless in six Western states. Idaho, where 4,000 have been driven from their homes, has been hit the hardest.

90 has perome a household term and its possible contamination of milk has been the subject of widespread speculation. Is there a danger? With each glass of milk that we drink, are

we running the risk of radio The answer is an emphatic no! The safety of our milk supply is not in jeopardy. Why, then, have scientists teamed up to determine methods of removing strontium 90 from milk? And why focus attention

on milk, rather than other foods? One reason for using milk as a measure of strontium 90 is that samples can be taken throughout the year representative of a large volume of production over a wide area. Thus, it is common to see figures about the strontium 90 level in milk. There is another important consideration. People are dis-

turbed about strontium 90 ir milk because of the large consumption of milk by children. Actually, milk is one of the safest foods so far as strontium 90 is concerned. Cows take into their systems only five per cent of the strontium 90 they ingest and secrete only a fifth of that five per cent in their milk. The danger of humans getting strontium 90 from milk produced by cows eating contaminal

with the danger from eating leafy vegetables which have had the same amount of

Furthermore, strontium 90 deposited in the bones, as is calcium. The more calcium one eats, the less strontium 90 will be taken up by the bones. Since milk is high in calcium, this is a further safety factor as far as humans are concerned. Canada pioneered research in

the removal of strontium 90 from milk. Three years ago, Dr. B. B. Migicovsky, a scientist on the staff of the agriculture depart ment's research branch, discovered a method of removing this long-lasting contaminant. The United States Department of Agriculture became interested in this Canadian research and car-ried it through the pilot plant

stage. Under Dr. Migicovsky's system, upwards of 98 per cent of the strontium 90 that gets into milk can be removed. It is a highly technical filtering process which leaves treated milk relatively un-changed with respect to compo-sition and flavor. The method involves the use of certain chemicals known technically as ionexchange resins. . . .

Present levels of strontium 90 in the world are so minute they can hardly be measured. The need to remove it from any food product does not exist today. It is still comforting to know that should the need ever arise, Dr. Migicovsky's technique for ridding milk of this component of radioactive fallout could be quickly put into effect on a commercial basis.

Fallout on the Farm is to be reprinted.

This "best selling" free booklet, prepared by the Canada Department of Agriculture at the

request of the Emergency Measures Organization, has been in steady demand since its publi-cation in April, 1961. The first 200,000 copies have been distributed, and English and French

editions will be reprinted to bring the total to 400,000 copies. Fallout on the Farm offers advice to farmers on how to avoid the immediate dangers of fallout from an atomic attack. It does not go into the long-range prob-lems or the effects on future generations. it describes a nuclear blast only to make the recmmendations understandable and it emphasizes what can be

tegic Air Command crews — and no doubt their Soviet counterdone to protect family and live parts - constantly rehearse their stock during the first few days deadly roles: Scrambling upon a simulated alarm, flying 36after an attack. hour missions, and "bombing" an assigned objective. Every element is as realistic as possible, with one obvious exception: There is no practice over the real targets. Now, the Air Force's deadly

game has been given an added efinement. Within the last fifteen months, the Air Force has quietiy planted two fields of tele-phone poles in isolated prairies in the Western United States. One City, S.D., and the other is 25 miles northeast of Glasgow, Mont. Each field contains 180 poles and covers 4 square miles. Each pole is topped by prism-shaped aluminum sheets 4 feet square. By adjusting the reflec-tor angles in a carefully calculated pattern, ground teams can duplicate the "radar image" of any city in the world. The trick is not unlike the flashcard pattern

Waiting For Moon To Do Its Stuff

The great total eclipse of Feb. 5 has answered the prayers of American solar physicists. While millions of Asians sought to forestall the end of the world with stall the end of the world with offerings and sacrifices, an eightman scientific team from the Hight Altitude Observatory at Boulder, Colo., the Sacramento Peak (N.M.) Observatory, and the National Bureau of Standards hoped to record it photographically from a seashbre at

graphically from a seashore at Lae, New Guinea. Twice before in the last five years, the U.S. team had traveled thousands of miles to record the totality and capture an unparalleled view of the solar chromosphere, the little-understood boundary between the visible disk of the sun and the encircling corona. In 1958, rain washed out the attempt from Danger Island in the South Pacific; a year later in the Canary Islands, clouds masked the sun seconds before totality occurred.

This time the heavens parted. "When we went out to the cameras after breakfast," Dr. John Firor of Colorado reported, "it was raining. At 8 a.m. the rain stopped but there were several layers of clouds. We were feel-ing terrible." Then, at 8'48 - two minutes
